**Police Central & Face Forensics Announce Partnership to  
add Advanced Face Recognition Capabilities  
to Police Central's Jail Management System**

Police Central's comprehensive Jail Management System is being enhanced with the addition of advanced face recognition technology. This will facilitate the recognition of unidentified offenders, including those who refuse to give their name when arrested. It will also identify individuals with multiple records under different aliases.

Atlanta-based PCI's customer base includes approximately eighty-five law enforcement agencies in ten states, including the City of Atlanta Police Department and the City of Atlanta Department of Corrections.

PCI's web-based Law Enforcement Software suite already comprises thirty-five modules covering all aspects of law enforcement. The face recognition capability will complement and add value to these.

The Face Forensics system is based on many years' experience in developing this type of technology for law enforcement, both in the US and overseas. It is specifically designed to be easy to integrate with systems like PCI's JMS. Recognition performance is unaffected by age, race, or color, and offers a search speed of over 1m faces/second. A police department can search the databases of adjacent police departments under appropriate controls.

Face Forensics is the only system in the world to provide partial face recognition – offering the ability to recognize injured faces, criminals wearing balaclavas, etc.

The Face Forensics team have also been responsible for the development of one of the largest pedophilic image recognition systems in the world – the UK Serious Organized Crime Agency's ChildBase system.
